## Royal Star Magnolia

*Magnolia stellata 'Royal Star'*

Height: 10 feet

Spread: 10 feet

Sunlight: ○ ●

Hardiness Zone: 4

### Description:

An ideal accent shrub or small tree for smaller landscapes featuring extremely fragrant star-shaped snow-white flowers in April; fast growing, multi-stemmed and compact; considered the hardiest magnolia of all

### Ornamental Features

Royal Star Magnolia is smothered in stunning fragrant double white star-shaped flowers with yellow eyes at the ends of the branches in early spring before the leaves. It has dark green deciduous foliage. The pointy leaves turn coppery-bronze in fall. The fruits are showy pink pods displayed in early fall.

### Landscape Attributes

Royal Star Magnolia is a dense multi-stemmed deciduous shrub with a more or less rounded form. Its average texture blends into the landscape, but can be balanced by one or two finer or coarser trees or shrubs for an effective composition.

This is a relatively low maintenance shrub, and should only be pruned after flowering to avoid removing any of the current season's flowers. Deer don't particularly care for this plant and will usually leave it alone in favor of tastier treats. It has no significant negative characteristics.

Royal Star Magnolia is recommended for the following landscape applications;

- Accent
- Mass Planting
- Hedges/Screening
- General Garden Use

### Planting & Growing

Royal Star Magnolia will grow to be about 10 feet tall at maturity, with a spread of 10 feet. It has a low canopy with a typical clearance of 3 feet from the ground, and is suitable for planting under power lines. It grows at a slow rate, and under ideal conditions can be expected to live for 80 years or more.

This shrub does best in full sun to partial shade. It requires an evenly moist well-drained soil for optimal growth, but will die in standing water. It is not particular as to soil type, but has a definite preference for acidic soils. It is quite intolerant of urban pollution, therefore inner city or urban streetside plantings are best avoided. Consider applying a thick mulch around the root zone in winter to protect it in exposed locations or colder microclimates. This is a selection of a native North American species.
